CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for
CC       the treatment of strabismus and blepharospasm associated with
CC       dystonia and cervical dystonia. Also used for the treatment of
CC       hemifacial spasm and a number of other neurological disorders
CC       characterized by abnormal muscle contraction.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 60-LYS-|-LEU-61 BOND OF
CC       SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE D NEUROTOXIN IS SYNTHESIZED BY D
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RT   gene encoding the nontoxic nonhemagglutinin component.";
RL   Int. J. Syst. Bacteriol. 46:1105-1112(1996).
CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure (By similarity).
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H) (By similarity).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Located at the top of the head of the 30S subunit, it
CC       contacts several helices of the 16S rRNA. In the 70S ribosome it
CC       contacts the 23S rRNA (bridge B1a) and protein L5 of the 50S
CC       subunit (bridge B1b), connecting the 2 subunits; these bridges are
CC       implicated in subunit movement. Contacts the tRNAs in the A and P-
CC       sites (By similarity).
CC   -!- SUBUNIT: Part of the 30S ribosomal subunit. Forms a loose
CC       heterodimer with protein S19. Forms two bridges to the 50S subunit
CC       in the 70S ribosome (By similarity).
CC   -!- SIMILARITY: Belongs to the S13P family of ribosomal proteins.

PT Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT serotype A, useful for producing the neurotoxin for vaccination against
PT botulism, comprises sequence expressible in host other than Clostridium.
XX
PS Claim 52; Page 162-164; 166pp; English.
XX
CC The invention relates to a nucleic acid molecule encoding a botulinum
CC neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC that is expressible in a host organism other than Clostridium, or has a
CC total A+T content that is less than about 70% The BoNT LC protein is
CC useful in vaccination against botulism, for eliciting protective immunity
CC in a mammal, for treating dystonias, spasticity, pain, ocular motility,

CC facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC conditions characterised by hyperactivity of the lower motor neuron, and
CC to control autonomic nerve function or tiptoe-walking due to stiff
CC muscles common in children with cerebral palsy. The sequences are also
CC useful for screening for botulinum neurotoxin inhibitors. This sequence
CC represents a botulinum neurotoxin light chain serotype A protein

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 35; Page 291-296; 428pp; English.
XX
CC This is the amino acid sequence of the type B toxin of Clostridium
CC botulinum Danish strain. The C fragment (see AAW68393-94) of the serotype
CC B toxin has been expressed as a histidine-tagged protein in Escherichia
CC coli. The invention relates to C. botulinum recombinant toxins. Methods
CC are provided which allow for the isolation of soluble recombinant
CC proteins free of significant endotoxin contamination. Preferred hosts for
CC production of the recombinant proteins are E. coli, insect cells and
CC yeast cells. The recombinant proteins are used as immunogens for the
CC production of vaccines and antitoxins that are useful in the treatment of
CC humans and animals at risk of intoxication with clostridial toxin.

CC   present invention. The present invention describes recombinant neurotoxin
CC   proteins which comprise a first and second domain, where the first domain
CC   is adapted to cleave one or more vesicle or plasma-membrane associated
CC   proteins essential to exocytosis, and where the second domain is adapted:
CC   (a) to translocate the protein into a cell; (b) to increase the
CC   solubility of the protein compared to the solubility of the first domain
CC   on its own, or (c) both to translocate the protein into a cell and to
CC   increase the solubility of the protein compared to the solubility of the
CC   first domain on its own, the protein being free of clostridial neurotoxin
CC   (CN) and free of CN precursor that can be converted into toxin by
CC   proteolytic action. The recombinant proteins can be used as therapeutic
CC   agents for targeting cells expressing a relevant substrate. The products
CC   can also be used as immunogens and as non-toxic standards for the
CC   assessment and development of in vitro assays for the detection of
CC   functional botulinum or tetanus neurotoxins either in foodstuffs or in
CC   environmental samples

XX
CC The present sequence represents a recombinant neurotoxin protein from the
CC present invention. The present invention describes recombinant neurotoxin
CC proteins which comprise a first and second domain, where the first domain
CC is adapted to cleave one or more vesicle or plasma-membrane associated
CC proteins essential to exocytosis, and where the second domain is adapted:
CC (a) to translocate the protein into a cell; (b) to increase the
CC solubility of the protein compared to the solubility of the first domain
CC on its own, or (c) both to translocate the protein into a cell and to
CC increase the solubility of the protein compared to the solubility of the
CC first domain on its own, the protein being free of clostridial neurotoxin
CC (CN) and free of CN precursor that can be converted into toxin by
CC proteolytic action. The recombinant proteins can be used as therapeutic
CC agents for targeting cells expressing a relevant substrate. The products
CC can also be used as immunogens and as non-toxic standards for the
CC assessment and development of in vitro assays for the detection of
CC functional botulinum or tetanus neurotoxins either in foodstuffs or in
CC environmental samples

PT   Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT   serotype A, useful for producing the neurotoxin for vaccination against
PT   botulism, comprises sequence expressible in host other than Clostridium.
XX
PS   Claim 52; Page 138-139; 166pp; English.
XX
CC   The invention relates to a nucleic acid molecule encoding a botulinum
CC   neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC   that is expressible in a host organism other than Clostridium, or has a
CC   total A+T content that is less than about 70% The BoNT LC protein is
CC   useful in vaccination against botulism, for eliciting protective immunity
CC   in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

PT Novel composition, comprising superoxide dismutase linked by a cleavable
PT linker to a neuronal cell targeting component useful for delivering
PT superoxide dismutase to neuronal cells to treat ischemia.
XX
PS Disclosure; Page 45-47; 65pp; English.
XX
CC The present sequence represents a construct of the invention, comprising
CC a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can
CC be cleaved by thrombin, and a heavy chain derived from botulinum
CC neurotoxin serotype B. The specification describes a composition for
CC delivery of SOD to neuronal cells. The composition comprises SOD linked,
CC by a cleavable linker, to a neuronal cell targeting component (NCTC).
CC This component has a domain that binds to a neuronal cell and a domain
CC that translocates the SOD of the composition into the neuronal cell.
CC After translocation, the linker is cleaved to release the SOD. The
CC composition is useful for treating neuronal diseases caused or augmented
CC by oxidative stress, such as ischemic stroke, trauma, Parkinson's
CC disease, Huntington's disease and motor neurone diseases

PT New polypeptide, useful for treating infections of Clostridium tetani,
PT comprises tetanus toxin fragment with a mutation in a loop region,.
XX
PS Disclosure; Page 39; 43pp; English.
XX
CC The present sequence is given in a specification relating to a novel
CC polypeptide comprising tetanus toxin (TeNT) fragment C or its immunogenic
CC fragment, containing a mutation in a loop region. The mutation results in
CC a reduction in the binding of TeNT fragment C or its immunogenic fragment
CC to gangliosides and primary motoneurones, and/or a reduction in the
CC ability of TeNT fragment C or its immunogenic fragment to undergo
CC retrograde transport. The polypeptide is useful for treating, preventing
CC and reducing the susceptibility to Clostridium tetani infection in a
CC human or animal, and also for producing antibodies which recognise groups
CC within TeNT polypeptides. Antibody produced against the polypeptide is
CC also useful for treating Clostridium tetani infection

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Disclosure; Page 13; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT toxin serotypes A-G, is used for inducing an immune response against
PT botulinum.
XX
PS Claim 28; Page 47-48; 54pp; English.
XX
CC The invention relates to novel vaccines that induce a protective immune
CC response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC DNA construct comprising a vector, and at least one nucleic acid fragment
CC comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC G. In preferred embodiments of the invention, the vector is a Venezuelan
CC equine encephalitis virus (VEE) replicon vector. Use of this vector
CC results in the production of large amounts of a protein encoded by a
CC sequence cloned into the replicon. The constructs are used to produce

CC vaccines against botulism. The proteins can also be used as diagnostic
CC tools for the diagnosis of botulism. The transformed host cells can be
CC used to analyse the effectiveness of drugs and agents which inhibit toxin
CC effects. The vaccine currently used against botulism is dangerous and
CC expensive to produce, and contains formalin, which is very painful for
CC the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC serotypes are represented in the formulation. The novel vaccine of
CC overcomes these problems, as it is easily purified, and available in
CC large quantities. It is also expressed in the lymph nodes for a better
CC immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC fragments used in the present invention. The DNA encoding these sequences
CC had been optimised for codon usage for expression in yeast

PT   Host cell containing recombinant expression vector encoding Clostridium
PT   botulinum type B or E toxin - useful to treat humans and other animals at
PT   risk of intoxication with clostridial toxin.
XX
PS   Example 49; Page 376-378; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (113/30 strain) type G neurotoxin, encoded by a DNA
CC   sequence (see AAV30596) in plasmid pETHisb. This vector can be used to
CC   express BotG soluble C fragment in Escherichia coli host cells, with the
CC   recombinant C fragment being purified on an affinity column. The
CC   invention relates to recombinant proteins derived from C. botulinum
CC   toxins, especially type B and type E toxins. Methods are provided which
CC   allow for the isolation of soluble recombinant proteins free of
CC   significant endotoxin contamination. Preferred hosts for production of
CC   recombinant proteins are E. coli, insect cells and yeast cells. The
CC   recombinant toxins are used as immunogens for the production of vaccines
CC   and antitoxins that are useful in the treatment of humans and animals at
CC   risk of intoxication with clostridial toxin

PT   Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT   serotype A, useful for producing the neurotoxin for vaccination against
PT   botulism, comprises sequence expressible in host other than Clostridium.
XX
PS   Claim 33; Page 129-130; 166pp; English.
XX
CC   The invention relates to a nucleic acid molecule encoding a botulinum
CC   neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC   that is expressible in a host organism other than Clostridium, or has a
CC   total A+T content that is less than about 70% The BoNT LC protein is
CC   useful in vaccination against botulism, for eliciting protective immunity
CC   in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

PT diarrhoea.
XX
PS Claim 4; Page 344-350; 434pp; English.
XX
CC Clostridium botulinum type A neurotoxin (AAR95010) is processed to form a
CC dimer composed of a light and a heavy chain. It is the product of the
CC type A neurotoxin gene (AAT29244). The 50 kDa C-terminal portion of the
CC heavy chain, or C fragment (see also AAR95008), was produced using a
CC synthetic gene (AAT29245) having codon usage altered to improve
CC expression in Escherichia coli. Fusion proteins of the type A toxin or C
CC fragment, with e.g. maltose binding protein or polyhistidine affinity tag
CC (see also AAR95008), are used to generate neutralising antitoxins and in
CC vaccine compsns

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

S48106
neurotoxin type E - Clostridium botulinum (fragment)
C;Species: Clostridium botulinum
C;Date: 14-Jul-1995 #sequence_revision 10-Nov-1995 #text_change 16-Jul-1999
C;Accession: S48106
R;Campbell, K.D.; Collins, M.D.; East, A.K.
J. Clin. Microbiol. 31, 2255-2262, 1993
A;Title: Gene probes for identification of the botulinal neurotoxin gene and specific id
A;Reference number: S48103; MUID:94013372; PMID:8408542
A;Accession: S48106
A;Status: preliminary; nucleic acid sequence not shown; translation not shown
A;Molecule type: DNA
A;Residues: 1-367 <CAM>
A;Cross-references: EMBL:X70818; NID:g407784; PIDN:CAA50149.1; PID:g407785
A;Note: the nucleotide sequence was submitted to the EMBL Data Library, January 1993
C;Superfamily: tetanus toxin
C;Keywords: neurotoxin

RT "Nucleotide sequence of the gene coding for Clostridium botulinum
RT (Clostridium argentinense) type G neurotoxin: genealogical comparison
RT with other clostridial neurotoxins.";
RL Biochim. Biophys. Acta 1216:487-491(1993).
CC -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC ENDOPEPTIDASE.
CC -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC detected action on small molecule substrates.
CC -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC heavy chain (H). The light chain has the pharmacological activity,
CC while the N- and C-terminal of the heavy chain mediate channel
CC formation and toxin binding, respectively.
CC -!- SUBCELLULAR LOCATION: Secreted (By similarity).
CC -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 76-GLN-|-PHE-77 BOND OF
CC       SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77
CC   BOND OF SYNAPTOBREVIN-2.
CC -!- CATALYTIC ACTIVITY: Hydrolysis of 76-Gln-|-Phe-77 bond in
CC   synaptobrevin 2.
CC -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC -!- SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO
CC   YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE
CC   AND ARE NON-TOXIC AFTER SEPARATION.
CC -!- MISCELLANEOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO
CC   GANGLIOSIDE RECEPTORS.
CC -!- SIMILARITY: Belongs to peptidase family M27.
CC --

RL   Nat. Struct. Biol. 5:898-902(1998).
CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for
CC       the treatment of strabismus and blepharospasm associated with
CC       dystonia and cervical dystonia. Also used for the treatment of
CC       hemifacial spasm and a number of other neurological disorders
CC       characterized by abnormal muscle contraction.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 180-ARG-|-ILE-
CC       181 BOND IN SNAP-25.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RT   "Organization and phylogenetic interrelationships of genes encoding
RT   components of the botulinum toxin complex in proteolytic Clostridium
RT   botulinum types A, B, and F: evidence of chimeric sequences in the
RT   gene encoding the nontoxic nonhemagglutinin component.";
RL   Int. J. Syst. Bacteriol. 46:1105-1112(1996).
CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure (By similarity).
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H) (By similarity).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 58-GLN-|-LYS-59
CC       BOND OF SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 60-LYS-|-LEU-61 BOND OF
CC       SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE D NEUROTOXIN IS SYNTHESIZED BY D
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RT   common to Clostridium botulinum type B, C1, D, and E toxins and
RT   tetanus toxin.";
RL   Infect. Immun. 56:898-902(1988).
RN   [4]
RP   IDENTIFICATION OF SUBSTRATE.
RX   MEDLINE=94038966; PubMed=7901002;
RA   Blasi J., Chapman E.R., Yamasaki S., Binz T., Niemann H., Jahn R.;
RT   "Botulinum neurotoxin C1 blocks neurotransmitter release by means of
RT   cleaving HPC-1/syntaxin.";
RL   EMBO J. 12:4821-4828(1993).
CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC   RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC   AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC   WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC   INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC   ENDOPEPTIDASE THAT CLEAVES SYNTAXIN.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC   neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC   detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC   heavy chain (H). The light chain has the pharmacological activity,
CC   while the N- and C-terminal of the heavy chain mediate channel
CC   formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC   botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE C1 NEUROTOXIN IS SYNTHESIZED BY C
CC   STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC   BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RC   STRAIN=VPI 10463;
RA   von Eichel-Streiber C.;
RL   Submitted (JAN-1997) to the EMBL/GenBank/DDBJ databases.
CC   -!- FUNCTION: Only after the enteral delivery of the enterotoxin A may
CC       the characteristic disease called pseudomembranous colitis be
CC       induced.
CC   -!- DOMAIN: THE C-TERMINAL PART OF TOXIN A CONSISTS OF A 833 AA
CC       REPETITIVE STRUCTURE. THIS PART OF TOXIN A IS COMPOSED OF FIVE
CC       DIFFERENT OLIGOPEPTIDES.
CC   ---------------------------------------------------------------------

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 49; Page 376-378; 428pp; English.
XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (113/30 strain) type G neurotoxin, encoded by a DNA
CC sequence (see AAV30596) in plasmid pETHisb. This vector can be used to
CC express BotG soluble C fragment in Escherichia coli host cells, with the
CC recombinant C fragment being purified on an affinity column. The
CC invention relates to recombinant proteins derived from C. botulinum
CC toxins, especially type B and type E toxins. Methods are provided which

CC allow for the isolation of soluble recombinant proteins free of
CC significant endotoxin contamination. Preferred hosts for production of
CC recombinant proteins are E. coli, insect cells and yeast cells. The
CC recombinant toxins are used as immunogens for the production of vaccines
CC and antitoxins that are useful in the treatment of humans and animals at
CC risk of intoxication with clostridial toxin

XX
PT Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT toxin serotypes A-G, is used for inducing an immune response against
PT botulinum.
XX
PS Claim 28; Page 47-48; 54pp; English.
XX
CC The invention relates to novel vaccines that induce a protective immune
CC response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC DNA construct comprising a vector, and at least one nucleic acid fragment
CC comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC G. In preferred embodiments of the invention, the vector is a Venezuelan
CC equine encephalitis virus (VEE) replicon vector. Use of this vector
CC results in the production of large amounts of a protein encoded by a
CC sequence cloned into the replicon. The constructs are used to produce
CC vaccines against botulism. The proteins can also be used as diagnostic
CC tools for the diagnosis of botulism. The transformed host cells can be
CC used to analyse the effectiveness of drugs and agents which inhibit toxin
CC effects. The vaccine currently used against botulism is dangerous and
CC expensive to produce, and contains formalin, which is very painful for
CC the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC serotypes are represented in the formulation. The novel vaccine of
CC overcomes these problems, as it is easily purified, and available in
CC large quantities. It is also expressed in the lymph nodes for a better
CC immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC fragments used in the present invention. The DNA encoding these sequences
CC had been optimised for codon usage for expression in yeast

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Claim 3; Fig 10b; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

XX
CC   This is the amino acid sequence of a histidine-tagged fragment C
CC   polypeptide of Clostridium botulinum serotype A toxin encoded by a DNA
CC   sequence (see AAV30572) in plasmid pHisBot, and by a DNA sequence (see
CC   AAV30575) in pHisBotA. These vectors were used to express native (i.e.
CC   non-fusion) soluble C fragment in Escherichia coli host cells, with the
CC   recombinant C fragment being purified on a poly-histidine binding
CC   affinity resin. The invention relates to recombinant proteins derived
CC   from C. botulinum toxins. Methods are provided which allow the isolation
CC   of soluble recombinant proteins that are free of significant endotoxin
CC   contamination. Preferred hosts for production of recombinant proteins are
CC   E. coli, insect cells and yeast cells. The recombinant toxins are used as
CC   immunogens for the production of vaccines and antitoxins that are useful
CC   in the treatment of humans and animals at risk of intoxication with
CC   clostridial toxin

PT   Host cell containing recombinant expression vector encoding Clostridium
PT   botulinum type B or E toxin - useful to treat humans and other animals at
PT   risk of intoxication with clostridial toxin.
XX
PS   Example 45; Page 339-341; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (Stockholm strain) type C1 neurotoxin, encoded by a
CC   DNA sequence (see AAV30588) in plasmid pETHisb. This vector is used to
CC   express BotC soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins,
CC   especially type B and type E toxins. Methods are provided which allow for
CC   the isolation of soluble recombinant proteins free of significant
CC   endotoxin contamination. Preferred hosts for production of recombinant
CC   proteins are E. coli, insect cells and yeast cells. The recombinant
CC   toxins are used as immunogens for the production of vaccines and
CC   antitoxins that are useful in the treatment of humans and animals at risk
CC   of intoxication with clostridial toxin

PT   Preparation of pyran-2-one derivative, used as intermediate and as
PT   additive for thermosensible transfer paper, comprises contacting carbonyl
PT   compound with microbe containing polyketide synthase gene.
XX
PS   Example 1; Page 10-11; 11pp; Japanese.
XX
CC   The present invention describes the preparation of pyran-2-one
```

CC derivatives. The preparation method comprises contacting carbonyl
CC compounds with microbes containing a polyketide synthase gene. Pyran-2-
CC one derivatives can be used as synthetic intermediates for drugs and
CC agricultural chemicals. They can also be used as additives for
CC thermosensible transfer paper. The present sequence represents the
CC Streptomyces griseus RppA protein with an N-terminal His tag, which is
CC used in an example from the present invention

PT Preparation of 1,3,6,8-tetrahydroxynaphthalene for use as a synthetic
PT material for melanine and as an intermediate for drugs and agricultural
PT chemicals, comprises using a microbe and an enzyme.
XX
PS Example 1; Page 9-10; 10pp; Japanese.
XX
CC The present invention describes a method for preparing 1,3,6,8-
CC tetrahydroxynaphthalene comprising using a microbe cell containing an
CC rppA gene encoding actinomycetes polyketide synthase, to convert malonyl
CC CoA as the substrate or a substance which can produce malonyl CoA in the
CC microbe cell to 1,3,6,8-tetrahydroxynaphthalene and recovering it.
CC 1,3,6,8-tetrahydroxynaphthalene is used as a synthetic material for
CC melanine and as an intermediate for drugs and agricultural chemicals. The
CC present sequence represents the actinomycetes polyketide synthase protein
CC isolated from Streptomyces griseus comprising an histidine tag, which is
CC used in an example from the present invention

PT New isolated RB47 and RB60 genes - used for, e.g. regulated expression of
PT desired recombinant molecule in prokaryote and eukaryote, particularly
PT plant cells.
XX
PS Claim 10; Fig 5; 109pp; English.
XX
CC The sequence is that of a histidine tagged RB47 mRNA binding protein. It
CC can be used in the regulated production of a desired recombinant
CC molecule. It can be used as a cell culture system, an in vitro expression
CC system or a whole tissue, preferably a plant and allows for a high level
CC of protein synthesis in plant chloroplasts and in the cytoplasm of both
CC prokaryotic and eukaryotic cells. It can also be used to screen for
CC agonists or antagonists of the binding of RB47 to the RB47 binding site.
CC Antagonists of the binding are useful in the prevention of plant
CC propagation. They can also be used for screening for agonists or
CC antagonists of RB60. Such agonists or antagonists would be useful in
CC general to modify expression of RB60 as a way to regulate cellular
CC processes in a redox manner

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RT "Nucleotide sequence of the gene coding for Clostridium botulinum
RT (Clostridium argentinense) type G neurotoxin: genealogical comparison
RT with other clostridial neurotoxins.";
RL Biochim. Biophys. Acta 1216:487-491(1993).
CC -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC ENDOPEPTIDASE.
CC -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC detected action on small molecule substrates.
CC -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC heavy chain (H). The light chain has the pharmacological activity,
CC while the N- and C-terminal of the heavy chain mediate channel
CC formation and toxin binding, respectively.
CC -!- SUBCELLULAR LOCATION: Secreted (By similarity).
CC -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC -!- SIMILARITY: Belongs to peptidase family M27.
CC ---

CC   -!- FUNCTION: Probably play a role in the development of the brain and
CC       the sense organs. Can bind to the BCD target sequence (BTS): 5'-
CC       TCTAATCCC-3' (By similarity). May play a role in the specification
CC       or differentiation of neurons in the deep layers of the cerebral
CC       cortex, and also in cerebellar regionalization during early
CC       development.
CC   -!- SUBCELLULAR LOCATION: Nuclear (Probable).
CC   -!- TISSUE SPECIFICITY: Brain: restricted regions of the developing
CC       rostral brain including the presumptive cerebral cortex and
CC       olfactory bulbs; expressed in the developing olfactory, auricolar
CC       and ocular systems, including the covering of the optic nerve (By
CC       similarity).
CC   -!- DEVELOPMENTAL STAGE: Expressed throughout the forebrain and
CC       midbrain during development, and in addition is also seen in
CC       discrete spatial and temporal domains in the developing cerebral
CC       cortex and cerebellum. Confined to a subpopulation of neurons in
CC       layers 5 and 6 within the adult cerebral cortex and during
CC       development expression is high in the progenitors of these deep-
CC       layer cells. Expressed in the developing cerebellum in spatially
CC       restricted regions of the external granular layer.
CC   -!- SIMILARITY: Belongs to the paired homeobox family. Bicoid

RT   "Design, synthesis and structure of a zinc finger with an artificial
RT   beta-turn.";
RL   J. Mol. Biol. 279:973-986(1998).
CC   -!- FUNCTION: MULTIFUNCTIONAL TRANSCRIPTION FACTOR THAT EXHIBITS
CC       POSITIVE AND NEGATIVE CONTROL ON A LARGE NUMBER OF CELLULAR AND
CC       VIRAL GENES BY BINDING TO SITES OVERLAPPING THE TRANSCRIPTION
CC       START SITE. MAY PLAY AN IMPORTANT ROLE IN DEVELOPMENT AND
CC       DIFFERENTIATION. THE FUNCTION OF YY1 AS AN ACTIVATOR OR A
CC       REPRESSOR IS SPECIFIED BY THE PRESENCE OF OTHER PROTEINS. FOR
CC       EXAMPLE IT ACTS AS A REPRESSOR IN ABSENCE OF ADENOVIRUS E1A
CC       PROTEIN BUT AS AN ACTIVATOR IN ITS PRESENCE.
CC   -!- SUBUNIT: Interacts with YAF2 through the region encompassing the
CC       first and second zinc fingers.
CC   -!- SUBCELLULAR LOCATION: Nuclear. Associated with the nuclear matrix.
CC   -!- SIMILARITY: BELONGS TO THE KRUEPPEL FAMILY OF C2H2-TYPE ZINC-
CC       FINGER PROTEINS.
CC   -!- SIMILARITY: Contains 3 C2H2-type zinc fingers.
CC   ---------------------------------------------------------------------

CC   -!- FUNCTION: Probably functions as a transcription factor in the
CC       earliest stages of the left-right (LR) body axis formation.
CC   -!- SUBCELLULAR LOCATION: Nuclear.
CC   -!- DISEASE: Defects in ZIC3 are the cause of X-Linked visceral
CC       heterotaxy (HTX1) [MIM:306955]. HTX1 is a disease characterized by
CC       congenital heart disease and alterations of visceral situs,
CC       including asplenia or polysplenia, symmetric liver, intestinal
CC       malrotation, and abnormal lung lobation.
CC   -!- SIMILARITY: BELONGS TO THE GLI FAMILY OF C2H2-TYPE ZINC-FINGER
CC       PROTEINS.
CC   -!- SIMILARITY: Contains 4 C2H2-type zinc fingers.

CC   -!- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77
CC       BOND OF SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Hydrolysis of 76-Gln-|-Phe-77 bond in
CC       synaptobrevin 2.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO
CC       YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE
CC       AND ARE NON-TOXIC AFTER SEPARATION.
CC   -!- MISCELLANEOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO
CC       GANGLIOSIDE RECEPTORS.
CC   -!- SIMILARITY: Belongs to peptidase family M27.
CC   ---------------------------------------------------------------------

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (113/30 strain) type G neurotoxin, encoded by a DNA
CC sequence (see AAV30596) in plasmid pETHisb. This vector can be used to
CC express BotG soluble C fragment in Escherichia coli host cells, with the
CC recombinant C fragment being purified on an affinity column. The
CC invention relates to recombinant proteins derived from C. botulinum
CC toxins, especially type B and type E toxins. Methods are provided which

```
CC   allow for the isolation of soluble recombinant proteins free of
CC   significant endotoxin contamination. Preferred hosts for production of
CC   recombinant proteins are E. coli, insect cells and yeast cells. The
CC   recombinant toxins are used as immunogens for the production of vaccines
CC   and antitoxins that are useful in the treatment of humans and animals at
CC   risk of intoxication with clostridial toxin

PT   Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT   toxin serotypes A-G, is used for inducing an immune response against
PT   botulinum.
XX
PS   Claim 28; Page 47-48; 54pp; English.
XX
CC   The invention relates to novel vaccines that induce a protective immune
CC   response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC   and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC   DNA construct comprising a vector, and at least one nucleic acid fragment
CC   comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC   G. In preferred embodiments of the invention, the vector is a Venezuelan
CC   equine encephalitis virus (VEE) replicon vector. Use of this vector
CC   results in the production of large amounts of a protein encoded by a
CC   sequence cloned into the replicon. The constructs are used to produce
CC   vaccines against botulism. The proteins can also be used as diagnostic
CC   tools for the diagnosis of botulism. The transformed host cells can be
CC   used to analyse the effectiveness of drugs and agents which inhibit toxin
CC   effects. The vaccine currently used against botulism is dangerous and
CC   expensive to produce, and contains formalin, which is very painful for
CC   the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC   serotypes are represented in the formulation. The novel vaccine of
CC   overcomes these problems, as it is easily purified, and available in
CC   large quantities. It is also expressed in the lymph nodes for a better
CC   immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC   fragments used in the present invention. The DNA encoding these sequences
CC   had been optimised for codon usage for expression in yeast

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Claim 3; Fig 10b; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

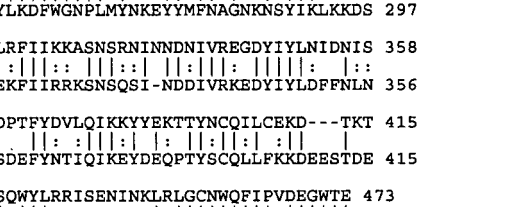
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (Danish strain) type B toxin, encoded by a DNA
CC   sequence (see AAV30581) in plasmid pETHisb. This vector was used to
CC   express soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins. Methods
```



CC are provided which allow for the isolation of soluble recombinant
CC proteins free of significant endotoxin contamination. Preferred hosts for
CC production of recombinant proteins are E. coli, insect cells and yeast
CC cells. The recombinant toxins are used as immunogens for the production
CC of vaccines and antitoxins that are useful in the treatment of humans and
CC animals at risk of intoxication with clostridial toxin

CC   The present sequence represents a construct of the invention, comprising
CC   a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can
CC   be cleaved by thrombin, and a heavy chain derived from botulinum
CC   neurotoxin serotype B. The specification describes a composition for
CC   delivery of SOD to neuronal cells. The composition comprises SOD linked,
CC   by a cleavable linker, to a neuronal cell targeting component (NCTC).
CC   This component has a domain that binds to a neuronal cell and a domain
CC   that translocates the SOD of the composition into the neuronal cell.
CC   After translocation, the linker is cleaved to release the SOD. The
CC   composition is useful for treating neuronal diseases caused or augmented
CC   by oxidative stress, such as ischemic stroke, trauma, Parkinson's
CC   disease, Huntington's disease and motor neurone diseases

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Example 8; Page 38; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT toxin serotypes A-G, is used for inducing an immune response against
PT botulinum.
XX
PS Claim 23; Page; 54pp; English.
XX
CC The invention relates to novel vaccines that induce a protective immune
CC response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC DNA construct comprising a vector, and at least one nucleic acid fragment
CC comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC G. In preferred embodiments of the invention, the vector is a Venezuelan
CC equine encephalitis virus (VEE) replicon vector. Use of this vector
CC results in the production of large amounts of a protein encoded by a
CC sequence cloned into the replicon. The constructs are used to produce
CC vaccines against botulism. The proteins can also be used as diagnostic
CC tools for the diagnosis of botulism. The transformed host cells can be
CC used to analyse the effectiveness of drugs and agents which inhibit toxin
CC effects. The vaccine currently used against botulism is dangerous and
CC expensive to produce, and contains formalin, which is very painful for
CC the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC serotypes are represented in the formulation. The novel vaccine of
CC overcomes these problems, as it is easily purified, and available in
CC large quantities. It is also expressed in the lymph nodes for a better
CC immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC fragments used in the present invention. The DNA encoding these sequences
CC had been optimised for codon usage for expression in yeast. Note: This
CC sequence is not given in the specification, but is decoded from the BoNTB
CC Hc DNA sequence given on pages 39-40

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Claim 3; Fig 4b; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 24; Page 265-267; 428pp; English.
XX
CC This is the amino acid sequence of a histidine-tagged fragment C
CC polypeptide of Clostridium botulinum serotype A toxin encoded by a DNA
CC sequence (see AAV30572) in plasmid pHisBot, and by a DNA sequence (see
CC AAV30575) in pHisBotA. These vectors were used to express native (i.e.
CC non-fusion) soluble C fragment in Escherichia coli host cells, with the
CC recombinant C fragment being purified on a poly-histidine binding
CC affinity resin. The invention relates to recombinant proteins derived
CC from C. botulinum toxins. Methods are provided which allow the isolation
CC of soluble recombinant proteins that are free of significant endotoxin
CC contamination. Preferred hosts for production of recombinant proteins are
CC E. coli, insect cells and yeast cells. The recombinant toxins are used as
CC immunogens for the production of vaccines and antitoxins that are useful
CC in the treatment of humans and animals at risk of intoxication with
CC clostridial toxin

XX
PS   Example 41; Page 327-329; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (NCTC 11219) type E neurotoxin, encoded by a DNA
CC   sequence (see AAV30585) in plasmid pETHisb. This vector is used to
CC   express BotE soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins,
CC   especially type B and type E toxins. Methods are provided which allow for
CC   the isolation of soluble recombinant proteins free of significant
CC   endotoxin contamination. Preferred hosts for production of recombinant
CC   proteins are E. coli, insect cells and yeast cells. The recombinant
CC   toxins are used as immunogens for the production of vaccines and
CC   antitoxins that are useful in the treatment of humans and animals at risk
CC   of intoxication with clostridial toxin

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RT "Nucleotide sequence of the gene coding for Clostridium botulinum
RT (Clostridium argentinense) type G neurotoxin: genealogical comparison
RT with other clostridial neurotoxins.";
RL Biochim. Biophys. Acta 1216:487-491(1993).
CC -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC ENDOPEPTIDASE.
CC -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC detected action on small molecule substrates.
CC -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC heavy chain (H). The light chain has the pharmacological activity,
CC while the N- and C-terminal of the heavy chain mediate channel
CC formation and toxin binding, respectively.
CC -!- SUBCELLULAR LOCATION: Secreted (By similarity).
CC -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for
CC       the treatment of strabismus and blepharospasm associated with
CC       dystonia and cervical dystonia. Also used for the treatment of
CC       hemifacial spasm and a number of other neurological disorders
CC       characterized by abnormal muscle contraction.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 180-ARG-|-ILE-
CC       181 BOND IN SNAP-25.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77
CC       BOND OF SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Hydrolysis of 76-Gln-|-Phe-77 bond in
CC       synaptobrevin 2.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO
CC       YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE
CC       AND ARE NON-TOXIC AFTER SEPARATION.
CC   -!- MISCELLANEOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO
CC       GANGLIOSIDE RECEPTORS.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 60-LYS-|-LEU-61 BOND OF
CC       SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
```

```
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE D NEUROTOXIN IS SYNTHESIZED BY D
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
